

Dataset Summary

The analysis is based on three integrated datasets: **Product**, **Store**, and **Orders**. The **Product dataset** contains details such as product ID, brand, category, sub-category, and product status, enabling product-level and brand-level performance analysis. The **Store dataset** includes store ID, store type, geographic attributes (state and city), and store activity status, supporting store-wise and regional performance evaluation. The **Orders dataset** captures transactional data such as order ID, order date, quantity, GMV, revenue, customer information, and order status, forming the core of sales and revenue analysis. Together, these datasets provide a comprehensive view of sales operations, customer behavior, product performance, and store-level effectiveness, enabling detailed revenue optimization and sales insights.
